PCBs are chemicals of great concern because of their persistence in the environment and their long biological half-life. So far, PCBs have been determined in blood or plasma samples. In the present study, the methodology for the determination of 19 metachloro-PCBs in formalin-fixed paraffin-embedded biopsies of tissues from previously exposed individuals and harbouring PCBs in their bodies is described. The protocol includes the extraction of the lipids from the tissue and cleanup with solid phase extraction. In a second step, the toxic PCBs are then separated by capillary gas chromatography with a detection limit of 0.2-0.5 microg/kg wet weight. Due to the low content of the analyte in the tissue matrix and low matrix effects, no additional cleanup procedure was necessary. The inter-batch reproducibility was good with relative standard deviations in the range of 5-20%. The recovery of the method ranged between 71% and 99% depending on the homogenization technique used. The procedure was applied to formalin-fixed paraffin-embedded tissue samples of previous exposed individuals, harbouring PCBs in their bodies.Q: Showing that X is a Riemann integrable function iff there exist a sequence of continuous functions converging to f uniformly on the domain of integration Question: show that $f\colon[a,b]\rightarrow\mathbb{R}$ is Riemann integrable if and only if there exists a sequence $\left\{f_n\colon[a,b]\rightarrow\mathbb{R}\right\}$ of continuous functions converging to f uniformly on the domain of integration. In the textbook I use the sequence $\left\{f_n\colon[a,b]\rightarrow\mathbb{R}\right\}$ given as follows: let $f_{-1}(t)=(t^2-4)/(t^2-$
